CITY OF LANSING

WORK SESSION AGENDA

800 1st Terrace Lansing, KS 66043

913-727-3233 Fax: 913-828-4579

www.lansing.ks.us

August 27, 2015 Thursday 7:00 p.m. Lansing City Hall

Call To Order:

- I. Discussion of Various Road, Bridge, and Stormwater Concerns
- a) Flooding Issues/Maintenance of 9 Mile Creek
- b) Bittersweet Street Bridge
- c) DeSoto Road
- d) Stormwater Utility

Adjournment

TO: Tim Vanda

Tim Vandall, City Administrator

FROM:

Sarah Bodensteiner, City Clerk

DATE:

August 20, 2015

SUBJECT: Work Session Summary

I. Discussion of Various Road, Bridge, and Stormwater Concerns

- a) Flooding Issues/Maintenance of 9 Mile Creek
- b) Bittersweet Street Bridge
- c) DeSoto Road
- d) Stormwater Utility
 - Staff will be present to facilitate discussions regarding items of concern.
- II. Adjournment

TO:

Tim Vandall, City Administrator

FROM:

John W. Young, Director of Public Works

V/

DATE:

August 21, 2015

SUBJECT:

Discussion of Various Road, Bridge, and Stormwater Concerns

9-Mile Creek: The Public Works Director will be in attendance to facilitate discussion of 9-Mile Creek flooding and maintenance issues. Specific detailed information from Lansing Correctional Facility on what services, in what locations, and under what circumstances they may be able to provide those services has been requested and we hope to have that response in time for the work session.

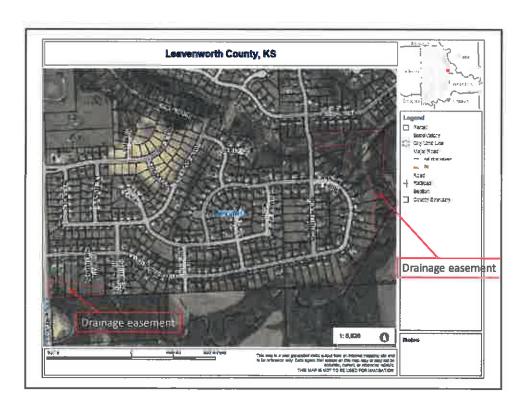

Bittersweet Street Bridge: The Public Works Director will be in attendance to facilitate discussion of the Bittersweet Street bridge and the associated concrete roadway approach slab and barriers that have settled resulting in an unsightly crack, along with any other issues such as graffiti, and vandalism of the hand rail along the walkway.

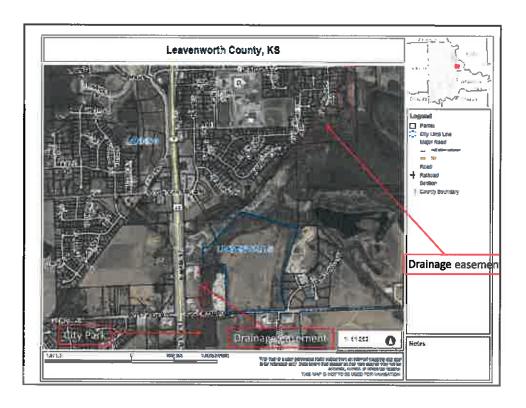

DeSoto Road: The Public Works Director will be in attendance to facilitate discussion of the history and options moving forward for the Ida to Eisenhower project, along with discussion of future needs for other portions of the road.

Stormwater Utility: The Public Works Director will be in attendance to facilitate discussion of the potential for funding stormwater needs via formation of a stormwater utility.

The attached PowerPoint slides will be available for the meeting if needed.

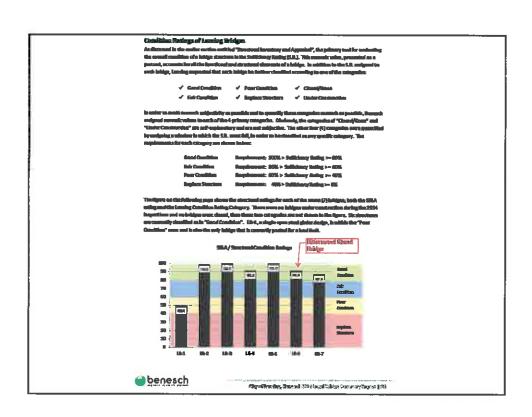

9-Mile Creek

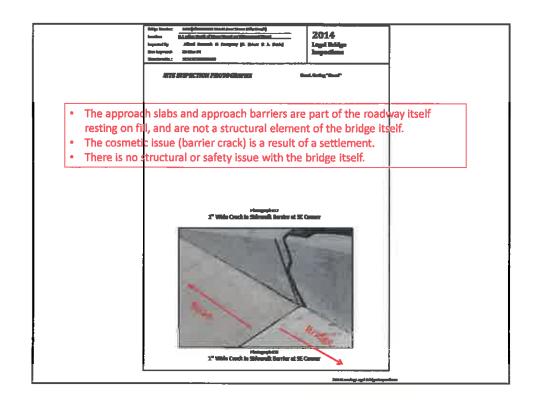

- Only small portions of 9-Mile Creek are in public drainage easements or on public land.
- Specific detailed information from Lansing Correctional Facility on what services, in what locations, and under what circumstances they may be able to provide those services has been requested and we hope to have that response in time for the work session.

DeSoto Road

DeSoto Road Project History

June 2005—earmark pitch: Councilman Robert Ulin convinced the Council that we should pick a road project and lobby Senator Robert's office earmark funds. Council directed staff to develop a concept for improvements on 147th Street (DeSoto Road) within the city limits. Staff developed a Parkway concept for the route and put together a brochure for Councilman Ulin and Mayor Bernard to take to Washington, D.C. The project, at the concept phase in 2005, was for a Parkway section from Cottonwood to Eisenhower, with a cost estimate of \$14 million. This was done without the benefit of any engineering studies. February 2006—city agreed to have KDOT perform noise study for environmental assessment to be paid for from the \$2 million of committed HDP (earmark) funds. \$4000.00 for noise study.

April 2006--city/state agreement for 4-H Road to Eisenhower Road executed
June 2006--advised by KDOT that there was no sunset on earmark funds

December 2006--Council enacted enabling resolution and made decision to proceed with design: staff recommended constructing from Mary to Ida Street, with preliminary estimate of \$4.05 million in local funding, as opposed to preliminary estimate of \$6.4 million for Ida to Eisenhower. Reasons were: higher traffic count, deficient bridge, steep hill; in effect, far more safety benefit provided by improving this section.

May 2009--updated city/state agreement: allowed earmark funds to be used for 80% of preliminary engineering costs (\$422,672). Local share of engineering \$105,668. This agreement included a sunset on the earmark funds, requiring them to be used on an active construction project within 10 years (fiscal year 2019, which begins October 2018) or the balance be forfeited and the amount spent repaid.

June 2009—work session – considered options of which phase to be designed: staff
recommended constructing from Mary to Ida as previously recommended in December.
July 2009—Council decided to proceed with design of Ida to Eisenhower over staff
recommendation of Mary to Ida. Council authorized design for a four-lane arterial facility
because the concept design would not have an adequate level of service throughout the 20
year design life, and there was not a significant cost difference between the original concept
and the four-lane facility.

<u>December 2009—began consultant selection process</u> (qualification based selection process)

<u>May 2010—three-party preliminary engineering agreement</u> with PEC and KDOT executed in the total amount of \$528,340. There was \$145,000 set aside in fund 70 for the project for local costs at this time.

May 2010—preliminary engineering began: <u>Traffic study indicated need for dedicated turn lane</u> at intersections and a two-way center turn lane in the portion of the project where there are closely spaced direct access driveways to the street.

May 2011—public information meeting showing plan and profile of roadway design, right-of-way and easement needs, etc. Wide solicitation of public comment for the project.

May 19, 2011—email distributed to all elected officials summarizing all public comments received and providing staff recommendations. Further comment from councilmembers was solicited by this email.

<u>August 2011—commitment by KDOT for \$200,000 safety funds for the Eisenhower intersection</u> - amended city/state agreement signed.

<u>December 2011—field check plans completed except for trail modification</u> to address public comment. Field check construction cost estimate \$7,984,000.

January 2012—field check completed: <u>KDOT authorization to begin right-of-way acquisition</u> and to proceed to office check plans

May 2012—capital and supplemental budget request for right-of-way acquisition - not funded

February 2013--Council declined to act on supplemental agreement for engineering services for additional work needed to redesign/relocate trail to address concerns expressed at public information meeting. Also at this meeting, the councilmembers from Ward 4 expressed concern about the design and asked why it wasn't designed as a three-lane facility. This is the first comment staff received from the Council about this matter . . . a year and nine months after we distributed summary of public comment and staff recommended responses in May 2011.

May 2013--office check plans submitted to KDOT without trail design completed

May 2013--capital and supplemental budget request for right-of-way acquisition - not funded

<u>June 2013--project removed from current MARC TIP – Project # 163004 (U-2113-01)</u>, due to being behind schedule – resubmit at next call for projects for 2019-20 construction. <u>July 2013--PEC began work on second office check plans</u>

Second office check <u>plans have been submitted to KDOT, without completion of trail design</u>. Construction cost estimate \$7,101,000.

May 2014—capital and supplemental budget request for right-of-way acquisition - not funded

<u>July 2014—PEC inquired about being relieved of remaining items in design contract</u> and terminating contract due to inactivity.

May 2015-capital and supplemental budget request for right-of-way acquisition - not funded

Federal funds currently dedicated to the project = \$2,200,00

Federal funds available from MARC = unknown

Federal funds spent to date = \$422,211 - pay back by 2019 if not under construction

Federal funds remaining to spend on construction and construction engineering = \$1,770,789

Estimated construction cost = \$7,101,000

Estimated construction engineering expense = \$710,100

Estimated right-of-way expense = \$450,000 (2010 estimate) - needed in 2017 latest

Estimated utility relocation expense = \$1,260,000 (2010 estimate) - needed in 2018 latest

Estimated total project cost = \$10,149,440

Local expenditure to date = \$105,553

Total of additional funds needed (local or combination of local and MARC) = \$7,843,887

dstudnicka@spcgtopal.net Cc: Terry Coder; Cindy; Dennis Thompson; Herb Mayfield; Jacobson; Justin Holden; Rebecca Savidge; Tim Dossey; Tracy Heim Subject: DeSoto Road Public Information Meeting - comments to date

- This was a successful meeting. 35 persons registered as attendees. Sufficient City Staff and Consultant Staff were on hand to explain the project and
- 11 comment forms were submitted at the meeting. We will be reviewing any additional comment forms as they come in. Displays prepared for the meeting are at Public Works and will be available for anyone who would like to see them. Comment forms are available at Public Works and on the City
- Summary of comments to date with some staff statements about design and process germane to the comments:
- 3 forms indicated everything about the project was positive.
- 1 person requested an entrance to their vacant property.
- There were 3 concerns expressed about speed limit on the new road...wanted to keep speed low.

Design speed for the project is 45 MPH, and the design is such that all safety considerations for a facility of that speed have been taken into account. The projected traffic growth for this project is such that capacity would be negatively affected by arbitrarily setting the speed limit low. That drag would extend to the ability to accommodate traffic from the side streets. Fed. funding and state law require speed limits to be set per traffic engineering study.

- There were 3 comments wanting the road to be one lane each direction with a two-way center turn lane.
- Projected traffic flow during the design life of the project will reach 16,580 vehicles per day which by appropriate traffic engineering criteria will require 4 lanes at design speed to effectively move the traffic. We must design for the life of the project, not for today's conditions. The two-way center turn lane is warronted because of entry and exit turns from the high number of residential access points along the route. The cost differe lane facility is minimal in the overall cost picture.
- 1 comment in addition to the 3 that said everything was positive, was in favor of the trail as shown, totaling 4 in favor as shown.
- 1 comment asked to move the trail closer to the creek.
- 2 comments were against a trail in yards near the creek.
- 2 persons from other neighborhoods not affected by the project <u>questioned</u> the location of the trail near the creek.
- All public projects and developments in Lansing since 2005 that are in areas where trails are shown on the Master Trail Plan have incorporated trails along ate corridor adopted in the plan by the Planning Commission and City Council that year. This preliminary alignment may easily be pushed closer to the creek, which is actually the ideal location, and privacy fence may be incorporated to screen the trail from the nearby houses and yards. Where possible the ideal location for the trail easement is within the existing drainage easement at the rear of these properties. Appropriate compensation will be provided for any pedestrian easement acquired as well as for any street right-of-way or other types of easements (there is a very formal and extremely fair process required for this by the Federal Government since Fed. funds are involved.)
- We welcome any questions and comments from Council Members as well as from the public throughout the design process as we continue toward a final

CHOICES

- 1. PAY BACK FEDERAL SHARE OF DESIGN COSTS.
 - a. This action will relieve the City Council from having to raise revenues to pay the local match for the project which, depending on the success of future funding requests, will amount to between \$3 million and \$8 million.
 - \$422,211 between now and 2019
- 2. REDESIGN PROJECT TO A THREE-LANE MINOR ARTERIAL SECTION.
 - a. Will require additional local funds for redesign, which will essentially offset any savings in construction cost. Funds for redesign will be needed in addition to funds for right-of-way in 2017 latest.
 - \$450,000 for right-of-way plus \$250,000 for redesign = \$700,000 in 2017
 - \$1,260,000 for utility relocation in 2018
 - Between \$2 million and \$8 million in 2019
- 3. PROCEED WITH PROJECT USING CURRENT DESIGN AND FINISH TRAIL DESIGN.
 - a. Will require commitment to follow through on funding.
 - \$450,000 for ROW plus \$25,000 to complete trail redesign = \$475,000 in 2017
 - \$1,260,000 for utility relocation in 2018
 - Between \$2 million and \$8 million in 2019

Stormwater Utility

2013 Strategic Planning Work Session

Why Consider a Utility?

- All developed property in Lansing contributes to the displacement of stormwater in proportion to the amount of impervious surface developed on the property (rooftops, driveways, patios, parking areas, etc.)
- Property valuation and ad valorem tax assessments are not proportional to displacement of stormwater.
- WATER > Charge for volume used
- WASTEWATER -> Charge for volume used (direct proportion to water use)
- ELECTRICITY > Charge for amount used
- GAS > Charge for volume used
- STORMWATER > Charge for amount of runoff generated

Researching Heartland v Mission to see if this argument will withstand a legal challenge

This fee is clearly assessed, in part, on how property owners decide to use their property. Plainly, the property owners' decision directly affects the City's determination of the amount of the direct and indirect volume of traffic each property generates, the type and size of such traffic, and the traffic generation factor. The larger the developed square footage and the greater the use or disposition made of the developed property, the greater the tax. In sum, this tax taxes the use of developed property and would have been prohibited as an unauthorized transactional excise tax under the former law.

With the broader prohibition of excise taxes now in effect, it is clear beyond a substantial doubt the transportation user fee is an excise tax or a tax in the nature of an excise and the City exceeded its home rule authority. See Kan. Const. art. 12, § 5(b); K.S.A. 12-194; see Executive Aircraft, 252 Kan. at 424-25.

Remaining issues

in the case of the stormwater utility fee, the owner's decision on the size of house and other impervious surfaces on the property affects the amount of the fee charged

Given our ruling here, we need not address Heartland's due process and equal protection arguments. The same is true for Heartland's argument raised after summary judgment was granted, that the City failed to properly follow the procedures in K.S.A.

Stormwater Funding

- To properly plan and operate a Stormwater program addressing the varied, often very expensive and complex capital projects, along with annual operations and maintenance, a stable, sufficient, revenue source is needed.
- Typical funding sources are a) unstable, as has been demonstrated by our own history with Stormwater budgeting; b) project-based (one time funding, grants, etc.); or c) temporary.
- In the absence of an autonomous program, we experience delays in projects and maintenance due to competition for general fund resources, budget cuts, unfunded regulations (next phase of NPDES), etc.
- Results:
 - Deferred maintenance leading to system failures and more expensive repairs.
 - Inability to fix recurring problems.
 - Failure to meet NPDES requirements . . . potential fines.
 - Large high priority projects deferred due to insufficient funding.

Stormwater Utility

- Has a dedicated method of funding separate from the General Fund.
- Has a budget separate from the General Fund within City Government, similar to the wastewater utility budget.
- Provides long term programmed approach to Stormwater issues.
- Provides for unified/coordinated management of planning, capital improvements, maintenance, regulation/enforcement, and administration/funding for Stormwater services.

Stormwater Utility Fee

- User/generator fee.
- Is charged to Stormwater runoff generators (customers) so the utility can manage the customers' runoff.
- Customers are owners of developed property in the City Limits.
- Fee is set to provide an amount adequate for demonstrated funding needs (operation and maintenance plus capital improvements as determined by a rate study).
- Fee is fair and equitable, based on the actual impact of each customer.
- Provides a dedicated revenue stream unaffected by the General Fund and other considerations.

Advantages of Stormwater utility

- Stable source of revenue.
- Sufficient funding for Lansing's specifically identified needs (Master Plan).
- Fair to all customers: residential, commercial, industrial, agricultural, large, small, etc.
- One less category to compete with the many other important General Fund needs.
- Ability to fund large projects and demonstrate progress to customers soon after inception.

EQUITABILITY

- The amount of Stormwater runoff produced is directly related to the area of impervious surface on a property.
- Rate structure is developed in proportion to area of impervious surface, so customers pay their fair share of the overall cost for the City to manage the excess Stormwater runoff that comes from their property due to impervious surfaces on the property.

In-House Work to Minimize Master Plan Costs

- Mapping of existing Stormwater infrastructure 95% Complete.
- Determination of current impervious surface area on all properties in the City – 95% Complete.
- Condition Inventory of existing Stormwater infrastructure – Suspended due to KERIT requirements.
- Identification of Stormwater problems Results of condition inventory will be added to current list of known Stormwater problems and citizen concerns.
- Estimate that mapping and inventory efforts already completed or to be completed by staff will reduce the cost of a master plan by \$65,000.

Stormwater Project Ranking Criteria

10 = likelihood of home or atore damage for <10 Yr. Return 9 = likelihood of home or atone damage for <25 Yr. Return 8 = likelihood of home or store damage for <50 Yr. Return 7 = likelihood of home or store damage for <100 Yr. Return

6 = likelihood of accessory structure damage for <10 Yr. Return 5 = likelihood of accessory structure damage for <25 Yr. Return 4 = likelihood of accessory structure damage for <50 Yr. Return

3 = likelihood of accessory situature damage for <100 Yr. Return 2 = likelihood of yard or grounds erosion 1 = likelihood of grounds Inundation 0 = no apparent risk

Public Infrastructure Risk

10 = Road or bridge could wash out or collapse @ <10 Yr, Return 9 = Road or bridge could wash out or collapse @ < 25 Yr. Return 8 = Road or bridge could wash out or collapse @ <100 Yr. Return 7 = Public building or other facility could be damaged @ <10 Yr. Return 8 = Public building or other facility could be damaged @ <25 Yr. Return 5 = Public building or other facility could be damaged @ <100 Yr. Return 5 = Public building or other facility could be damaged @ <100 Yr. Return o = Pruille buillang or orner rearity ocula be damaged gg <100 4 = Pipe or inlet (not under street) could collapse or undermint 3 = Ditch liner could wash out 2 = Ditch/ornamel could erode to unsefe condition 1 = likeliflood of grounds erosion or inundation 0 = no apparent risk

Population Vulnerability 10 $^{\rm m}$ High likelihood of danger to large groups (such as schools) 5 = High likelihood of danger to individuals 0 $^{\rm m}$ Little risk to persons

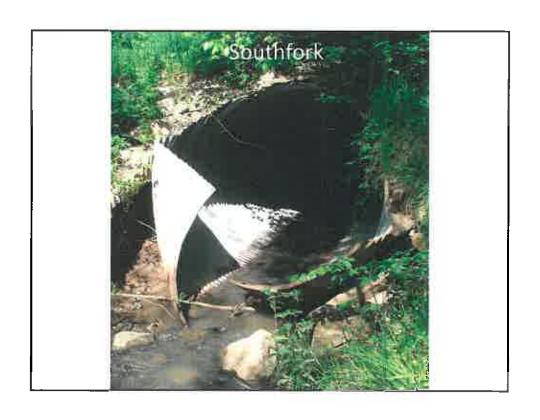

10 = Will not perform function intended Existing Condition

Cost Benefit

10 = High benefit per \$1 of estimated cost

Reasons Needed

- Flooding life safety, property risk
- Deteriorating infrastructure
- Revenue concerns
- Development impacts
- NPDES requirements
- Water pollution concerns

Process

- Stakeholder involvement/education
 initiative (residential, commercial, industrial, agricultural, institutional property owners/businesses)
- 2. Decide on type of rate structure
- 3. Set program objectives and priorities
- 4. Master plan and rate study (temporary note)
- 5. Charter Ordinance
- 6. Utility Ordinance
- 7. Rate Ordinance
- 8. Bond Sale
- 9. Implementation

Financing

- One portion of revenue stream dedicated to maintenance.
- One portion of revenue stream dedicated to capital projects and to stormwater master plan.
- Capital projects and master plan/rate study are eligible for bond financing.
- Financing makes it possible to deliver larger and more high priority projects in the near term so the public receives immediate and noticeable benefit from the fee.

Developed Properties (2013)

- There are over 568 acres of impervious surface on the over 2,949 developed properties in Lansing.
- The average area of impervious surface on our 1,345 single family residential properties in R-1 is 3,920 square feet, or 0.09 acres.
- For purposes of the following examples, 3,920 square feet was used as one Equivalent Residential Unit (ERU). 568 acres yields a total of 6,309 ERU in the City.
- A rate study will likely establish a rate structure such as .75 ERU for very small houses, and 1.25 ERU for extremely large houses in R-1 zoning, as a matter of equitability, and a rate per square ft. of actual measured impervious surface for all other zoning categories.
- For purposes of the following examples, a home appraised at \$200,000 is assumed to be billed for 1 ERU.

	Example #1 (\$2 million) (bond rate 4.4%)										
Year	Utility Fee Revenue (95% collection rate; 0.5% annual growth)	Bond Payment	Operation and Maintenance	Monthly Utility Bill per ERU	Equivalent Mil Levy	Monthly Property Tax on \$200,000 Home
